## 1. General Overview

### Project Name

SantéMPI

### Organisation

SanteSuite Inc.

### Project country

Global

### Geographic scope

Myanmar national MPI initiative. Tanzania, as foundational component of the TIMR immunization registry System.

### Overview of the digital health implementation

Many LMICs lack standardized approaches and/or systems for assigning, identifying or managing the identity of citizens interacting with the health system. There often also no requirement to collect a minimum set of demographic information during patient registration. Most often this results in multiple identifiers being assigned to citizens in paper-based and/or digital health systems across different points of service. This presents a significant barrier to achieving UHC by shifting digital health to person-centered care, reducing the burden of indicator reporting on frontline health workers, improving the accuracy and timeliness of data and establishing integrated, national digital health ecosystems. SantéMPI is a robust, fully featured Master Patient Index/Client Registry (MPI/CR) platform that facilitates implementation of national scale unique health ID as well as data harmonization, sharing and interoperability across digital health landscapes.
